Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel array comprising at least two isolated nucleotide molecules, each molecule having a sequence capable of uniquely hybridising to a nucleic acid molecule which is an expression product of a gene involved in mitochondrial biology. The array comprises two or more isolated nucleic acid molecules or spots, each molecule having a sequence chosen from sequence of 994 human probes and 2046 mouse probes. An array of the invention is useful for determining an expression profile of a mouse or human sample containing nucleic acid, by contacting the array with the sample under conditions allowing selective hybridisation, and measuring hybridisation of nucleic acid in the sample to the array to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Array containing probes for genes involved in mitochondrial biology, useful for determining mitochondrial biology gene expression profiles for use in diagnosing pathologies and identifying biochemical pathways.
                                                                                                                                                                                                                                                                                            50 Argogoriogagocorrrancionaagoagarcargacogrocacoacaagoagoca 109

produce an expression profile. The array is also useful for determining an expression profile of a first labelled sample containing nucleic acid acid. The second sample is a reference or a standard. An array is useful for determining an expression profile diagnostic of an energy-metabolism-related physiological condition. An array of the invention is useful for determining mitochondrial biology gene expression profiles of organisms, such as human, mice and closely related species, tissue and organisms, such organisms, which are useful for determining expression profiles diagnostic of energy metabolism-related physiological conditions, diagnostic such physiological conditions, identifying biochemical pathways, genes, and mutations involved in such physiological conditions, constitutions, and mutations involved in such physiological conditions, evaluating and/or monitoring the efficacy of such therapies, and creating and identifying animal models of human conery metabolism-related physiological conditions. Evaluating and identifying animal models of human useful for defining expression signatures or profiles for mitochondrial diseases, as well as distinguishing clinical disorders that result from oxidative phosphorylation (OXPHOS) dysfunction, oxidative stress, apoptosis and aging. An array of the invention contains probes of genes one previously recognised to participate in mitochondrial DNA sequences shown in ADD33224-ADD35260 represent mutine mitochondrial DNA sequences shown in ADD33224-ADD35260 represent mutine mitochondrial DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1426

acid substitution in a region which does not affect enzyme activity, of a positively charged amino acid residue, which has the effect of raising the isoelectric point of the peptide. These Mn-SoD variants are useful as medical prepns. for the treatment of human arthritis and diseases caused by active oxygen, and as cosmetic prepns. They are also useful for treatment of inflammation, cancer, premature retinopathy, hypertension and diabetes. Examples of variant Mn-SoDs are given in AAQ70431-32. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                           manganese super-oxide dismutase with aminoacid mutation in regions - for treatment of arthritis, active oxygen related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    106 GCCTACGTGAACAACCTGAACGTCACCGAGGAGAAGTACCAGGAGGCGTTGGCCAAGGGA 165

                                                                         agent comprising determining the expression of a rat toxic response gene(s) in the test animal in response to the agent. The method is useful in drug development, particularly for conducting toxicity studies and analysis before a new drug or compound is approved for human consumption or use. The method is also useful in determining toxicological responses to a new drug. This polynucleotide sequence represents a phase-1 rat CT gene of the invention

                                          The sequence encodes a maganese superoxide dismutase which can be used to catalyse the reduction of superoxide (SO) radicals to hydrogen peroxide and molecular oxygen. It can be used to reduce reperfusion injury following ischaemia and prolong the survival of excised organs. It can also me used as a long acting anti-inflamatory drug. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                   1367 ACTTATGTTAACGGCCTCAACGCTGCCGAGGAGGTACTCGGCCGCTGTGGGCAAGGAG 1426
                                                                                         has been isolated from a human T-lymphocyte cDNA library in phage lambdagel in Escherichia coli, by screening with a 5-probe (AATI5591) and a 3'-probe (AATI5592). The sequence of the insert in plasmid ph88-4 (obtained by subcloning in plasmid pB83-22) is shown. The cDNA may be expressed in e.g. E. coli for production of recombinant MnSOD. The MnSOD product may be cleaved with Aeromonas proteclytica aminopeptidase to pistidine residues removed. The MnSOD analogue with lysine and optionally histidine residues removed. The MnSOD analogue with lysine and optionally conditions associated with generation of oxygen free radicals, particularly synovial inflammation, arthritis and lung fibrosis (claimed). (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                              210
                                                                                                                                                                                                                                                                                                                                                                                            211 GCCTACGTGAACAACCTGAACGTCACCGAGGAGAAGTACCAGGAGGCGTTGGCCAAGGGA 270
           New human manganese super:oxide dismutase analogues - having a Lys and opt. His residue absent from the N-terminus, useful for treating e.g. synovial inflammation, arthritis or lung fibrosis.
                                                                                                                                                                                                                                                                                                                                         Manganese superoxide dismutase; MnSOD; reperfusion injury; ischaemia; bronchial pulmonary dysplasia; inflammation; antiinflammatory; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1367 ACTIATGITAACGGCCTCAACGCTGCCGAGGAGGAGCTACTCGGCCGCTGTGGGCAAGGAG 1426
                                                                                                                                                                                                                                                                                                                                                                                                                               A cDNA clone (AAT34277) codes for human manganese superoxide dismutase (MnSOD) (AAW00018), an enzyme that catalyges the reduction of superoxide radicals to H2O2 and 02. It was isolated from a human T - cell library cloned into vector g100 using probes (see also AAT34283- 84) based on portions of mature MnSOD. The MnSOD gene was also identified (see also AAT34278-82). The cDNA can be used for the prodn. of recombinant MnSOD using e.g. Escherichia coll cells as hosts. The MnSOD is useful for reducing reperfusion injury, treating inflammation or bronchial pulmonary dysplasia and for prolonging survival of excised organs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                           This cDNA sequence codes for human manganese superoxide dismutase
(hwm.SOD, see AAW98169). Novel MnSOD proteins having catalytic activity
which differs from this natural hum.SOD are claimed. The modified proceins
exhibit reduced or no product inhibition, or have greater activity, or
both, compared to natural hum.SOD. The modifications involve one or amino
acid substitutions within the active site of the enzyme, especially at
residues His-26, His-30, Tyr-34, His-74, Gln-143, Asp-159, Trp-161 and
His-163 (see also AAW98171-77). Nucleic acids encoding the modified and
hum.SOD proteins are also claimed. The modified hum.SOD proteins, or
cypresidue the which modified hum.SOD nucleic acids is linked to a
promoter (preferably mammalian), can be used to protect a cell linke from
damage caused by superoxide radicals (claimed). They can also be used to
treat subjects suffering from, or at risk of, cytotoxicity caused by
superoxide radicals (claimed) As such, they can be used as antioxidants
in the treatment of a variety of disorders, including inflammation
(claimed), reperfusion injury following ischemia (claimed), and cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1367 ACTIATGITAACGGCCTCAACGCTGCCGAGGAGAGCTACTCGGCCGCTGTGGGCAAGGAG 1426

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a human manganese superoxide dismutase protein (hwn SOD). The specification describes a medified hwn SOD which has a catalytic activity which differs from natural hwn SOD in that it exhibits reduced or no product inhibition compared to natural hwn SOD. The natural hwn SOD is especially modified with one or more substitutions in amino acids 26, 30, 34, 74, 143, 159, 161 and 163. The modified hwn SOD is useful for protecting a cell from damage caused by superoxide radicals and for treating a cell from damage caused by superoxide radicals. The protein is useful for treating inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human manganese superoxide dismutase protein useful as antioxidant for treating cytotoxicity caused by superoxide radicals, inflammation and reperfusion injury following ischemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              211 gectracergaacergaacercaeceaedaaaaraeraecaegaagergeeerrageedaagga 270

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the nucleotide sequence of human manganese supercoxide dismurase (hSODM) cDNA. The cDNA was isolated from an adult human kidney cDNA library in lambda-gt10 using the probes given in ABN84889-90. The invention relates to methods for hSODM gene cloning and expression in microorganisms, especially Escherichia coli or Saccharomyces cerevitates. The hSODM cDNA is inserted into a vector for expression in the microbial host, preferably under conditions which allow for processing to remove the N-terminal methionine. The expression product is useful for treating a patient having inflammancory joint disease (e.g. osteoarthritis or rheumatoid arthritis), or to minimise post-ischaemic tissue damage resulting from disease or surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to a method of treating a patient with inflammatory joint disease. The method involves intra-articularly injecting into the afflicted joint a solution of human manganese superoxide dismutase (hSODm). The treatment is used to treat an inflammatory joint disease, particularly osteoarthritis or rheumatoid arthritis. The method can also be used to treat post isohemic tissue injury. The present sequence represents a CDNA encoding the hSODm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 268 GCCTACGTGAACATCTGAACGTCACCGAGGAGAAGTACCAGGAGGCGTTGGCCAAGGGA 327

monitoring of therapy having, on its surface, sequences of some or all of monitoring of therapy having, on its surface, sequences of some or all of specified monocyte-macrophage genes and also of other genes or RNA complementary to the specified genes. The device of the invention may be used to determine gene expression profiles for measurement of monocyte or macrophage activation or inflammation in blood or other tissues, as well set for the diagnosis, prognosis and monitoring therapy in cases of theumatoid arbritis, chronic inflammatory disease, chronic bacteriatinduced inflammation, arteriosclerosis, tumours, organ or tissue classification and sepais. The device provides information for molecular classification and staging of disease, creation of a patient-specific prognostic profile and suggestions about molecular pathogenesis or therapeutic effects, thus facilitating the development of new therapeutic the human RKX DNA of the invention 0 1367 ACTIAIGITAACGGCCTCAACGCTGCCGAGGAGCTACTCGGCCGCTGTGGGCAAGGAG 1426 Device for diagnosis, prognosis and monitoring therapy of e.g. rheumatoid arthritis, comprises immobilized gene sequences from monocyte-macrophage 67 decengdaacencaeareaaegeegagareargeagergeaeergeaeeaegageaeege 126 127 gecriacergaacarcergaacercaeceaegaagaagraecaegageegriegecaagega 186 .; 0 Sequence 930 BP; 242 A; 208 C; 206 G; 245 T; 0 U; 29 Other; 2.0%; Score 74; DB 9; Length 930; 67.5%; Pred. This invention relates to a combination comprising several CDNAs that are disferentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed companies. The cDNAs of the invention may have antiarteriosclerotic; cytostatic; cardiant; hypotensive; antidiabetic; cynaecological; vasotropic and cerebroprofective activities and may be used in gene therapy. The CDNAs of the invention may be used in gene therapy. The CDNAs of the invention may be used in a sample, or screening several molecules or compounds to identify a molecule or compound that specifically binds a CDNA of the invention. A protein encoded by the CDNA may be used to screen several contents or compounds to identify a ligand that specifically binds to the protein, or to produce or purify an antibody to the protein that can be used to detect a protein in a sample. The nucleotides may be useful for recombinant protein from a sample. The nucleotides may be useful for diagnosing, treating, or monitoring the progression of treatment of a vascular disease, e.g. atherosoclerosis, cancer, coronary artery disease, hypertension, diabetes, pre-eclampsia, ischeemia reperfusion conjury, restension, diabetes, pre-eclampsia, ischeemia reperfusion conjury, restension, diabetes, pre-eclampsia, ischeemia reperfusion conjury, restension, diabetes, pre-eclampsia, ischeemia caid caid associated with abnormalities in the expression, amount or aute diseases associated with abnormalities in the expression, amount or distribution of the protein. The present sequence represents a cDNA of the invention content is adifferentially expressed in activated vascular tissue. Note: The content of the specification, but the content of the specification, but the content of the sequence data for this patent did of form to the protein the detection of the protein contents of the sequence data for this patent did detectly from used for the protein contents of the specification, and directly from the contents of th

The present invention describes a method (M1) for screening for an anti-
neoplastic agent. The method involves exposing cells to a chemical agent
to be tested for anti-neoplastic activity, determining a change in
comprises a sequence (S) selected from 847 sequences (given in ABL61664
comprises a sequence (S) selected from 847 sequences (given in ABL61664
comprises a sequence (S) selected from 847 sequences (given in ABL61664
comprises a sequence (S) selected from 847 sequences (I)
activity and can be used in the incoplastic activity. (I) has cytostatic
activity and can be used in gene therapy. MI can be used for screening an
anti-neoplastic agent, and can be used for producing a product which is
the data collected with respect to the anti-neoplastic agent as a result
of MI, and the data is sufficient to convey the chemical structure and/or
properties of the agent. MI can be used in the treatment of cancer such
as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney,
prostate or pancreatic cancer, adenome, clear cell
cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous
cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Milm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1367 ACTIAIGITAACGGCCTCAACGCTGCCGAGGAGAGCTACTCGGCCGCTGTGGGCAAGGAG 1426

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
